DETAILED ACTION

NEW REJECTIONS

Claim Rejections – 35 USC § 103(a)

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 36 – 39 are rejected under 35 U.S.C. 102(b) as being anticipated by Imasaki et al (U.S. Patent Application Publication No. 2003/0094209 A1).

With regard to Claims 36 and 38, Imasaki et al discloses a tube by electroforming produced by forming an electrodeposit around a thin wire material and removing the thin wire (paragraph 0055); the tube comprises layers having different conductivity (paragraph 0064); the claimed aspects of the pulling of the wire deforming the material and electrodeposition are directed to process limitations and are therefore given little patentable weight. Imasaki et al fail to disclose a conductive layer having a higher electrical conductivity than the outer layer and thickness of the outer layer of 5 to 50 microns. However, as stated above, Imasaki et al disclose layers having different conductivity, and Imasaki et al disclose the selection of thickness depending on the desired use of the end product (paragraph 0065). It therefore would have been obvious for one of ordinary skill in the art to provide, through routine experimentation, a thickness and conductivity depending on the desired use of the end product as taught by Imasaki et al.

With regard to Claims 37 and 39, Imasaki et al fail to disclose a diameter of 10 to 85 microns. However, Imasaki et al disclose the selection of diameter depending on desired use of the end product (diameter of 127 - 129 microns is only one embodiment; paragraph 0052).). It therefore would have been obvious for one of ordinary skill in the art to provide, through routine experimentation, a diameter depending on the desired use of the end product as taught by Imasaki et al.
